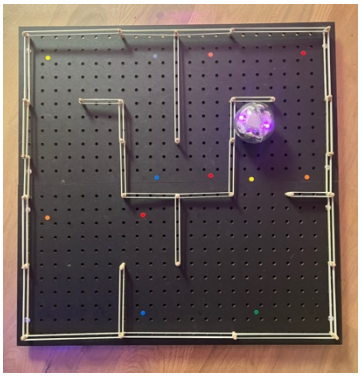
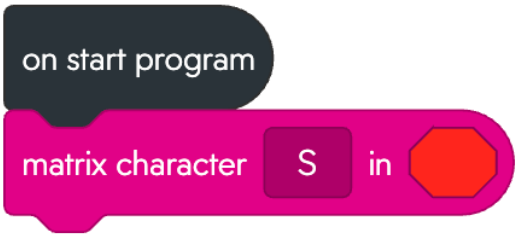
Ice-Slide Maze



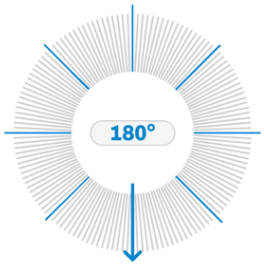
Guide a bump'n'turn BOLT robot around a maze, turning only when you bump into a wall. This is called an ice-slide maze. Do a clockwise loop around the maze, starting and finishing at the top-right corner.

1) In Chrome, open https://edu.sphero.com/code
2) Connect your **Sphero BOLT** robot: click CONNECT
3) Select SPHERO BOLT then CONNECT
4) Your BOLT has a sticker with a code on it. Choose the matching BOLT from the list then Pair
5) Check your robot is showing the right image then CLOSE
6) Click **+ CREATE PROGRAM**. + CREATE PROGRAM
7) Input a name for your program. Leave **BLOCKS** selected. Select **SPHERO BOLT** and **deselect SPHERO BOLT+** then click **CREATE.**
8) Add code to display the initial **character** of your name so you can find your robot in a crowd. Choose a colour for it.



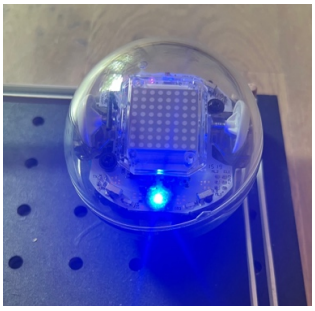
START *the code. Does it work?*

Use the coloured dots as a guide round the maze. Move from one dot to the next by rolling ***up*** *(0 °),* ***down*** *(180°),* ***left*** *(270°), or* ***right*** *(90°).*



9) Add code to **roll** down from the first (red) dot to the second (orange) dot at speed **30** for **5** seconds. Change the angle by dragging the arrow to point in the right direction. Change speed by clicking on the slider and using the up/down keys.

10) Place the BOLT in the red corner and adjust the **aim**. Click AIM then use the left/right keys to aim BOLT so that the blue light (it's tail) points down.



START *the code. Does it work?*

11) Add more roll blocks to complete the maze. There are 12 coloured dots so it needs 12 **rolls**.

Restart the BOLT from the red corner each time you run the code. You may need to correct the aim now and again.

To ***Save*** *your code go back to the main page. Click on the 3 dots (ellipsis) next to your program and download to a USB drive.*
