Whac-a-Mole

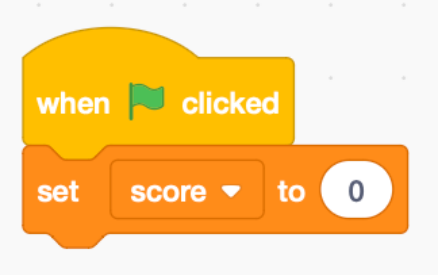
*The classic **Whac-A-Mole** game where moles pop up at random. Points are scored by whacking each mole as it appears.*

1) Download the mole image from: https://codeclub67.github.io/images/mole.gif

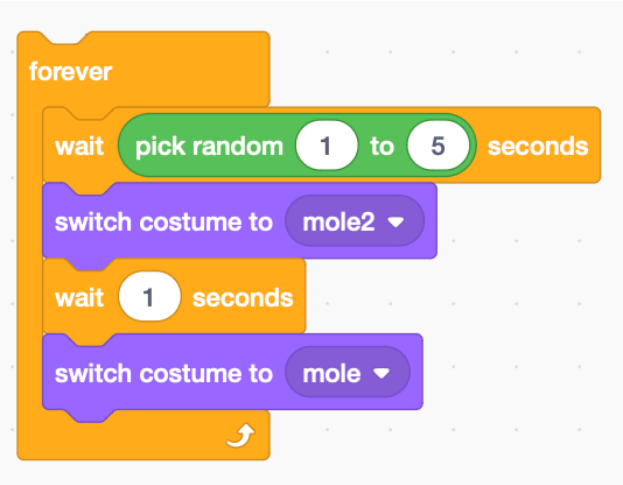
2) Create a new sprite and choose **upload sprite** to get the downloaded mole image. Have a look at the costumes.

This is an animated GIF including costumes for the mole being both down & up.

3) Keep track of the number of moles you whack by adding a score. **Make a variable** (for all sprites) called **score**.



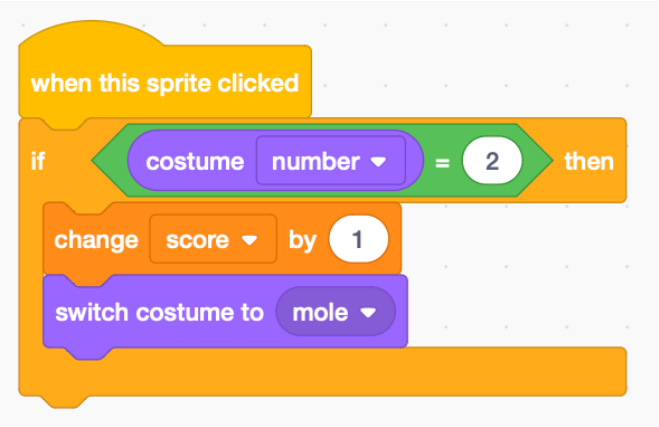
4) Clear the score at the start of the game.



5) Add a **forever** loop to the code above.

6) Inside the loop, the mole **waits** for a **random** time before popping up, and then pops down again after 1 second.

7) To tell when the mole is whacked, detect **when this sprite clicked**.

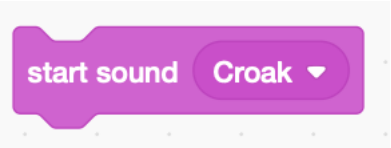


8) Only increase the score **if** the mole is up, when **costume number = 2**

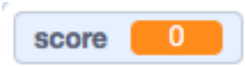
9) Once the mole has been whacked, switch the costume back to the mole being down.

10) Add a sound effect to the mole. On the **sounds** tab click **choose a sound**. I added a "croak" sound.

11) Add this code to the **if** block above to **start** playing the sound if the mole is hit.



*Make the game harder by **duplicating** the sprite as many times as you like and put them side-by-side.*



*Remember to **Save** your code with a good name.*
