

Edge Tracker

<https://makecode.microbit.org>

Make a robot follow the edge of a track

Import the maqueen library

- 1) Open <https://makecode.microbit.org>
- 2) **+New Project**
- 3) Select **+Extensions** > click “maqueen”
(not Maqueenplus)

m Maqueen

maqueen

Maqueen is an easy-to-use programming educational Robot

Hold the robot over the black track and move it left and right.

See the blue lights on each side switch off when it's held over the track.

*The robot has a pair of **infra-red reflectance** sensors you can see underneath.*

Simple edge tracker

Use the right (or left) sensor to see if the robot is on or off the line.

Run just the right motor to steer left, and just the left motor to steer right.

```
on right line tracking sensor low
  motor left stop
  motor right move Forward at speed 20

on right line tracking sensor high
  motor left move Forward at speed 20
  motor right stop
```

- **Low** indicates the dark track
- **High** indicates white off-track

- 1) Add the code (left)
- 2) Connect the robot and download the code
- 3) Switch on the robot using the switch at the 'tail'
- 4) Unplug the robot
- 5) Place it on the track

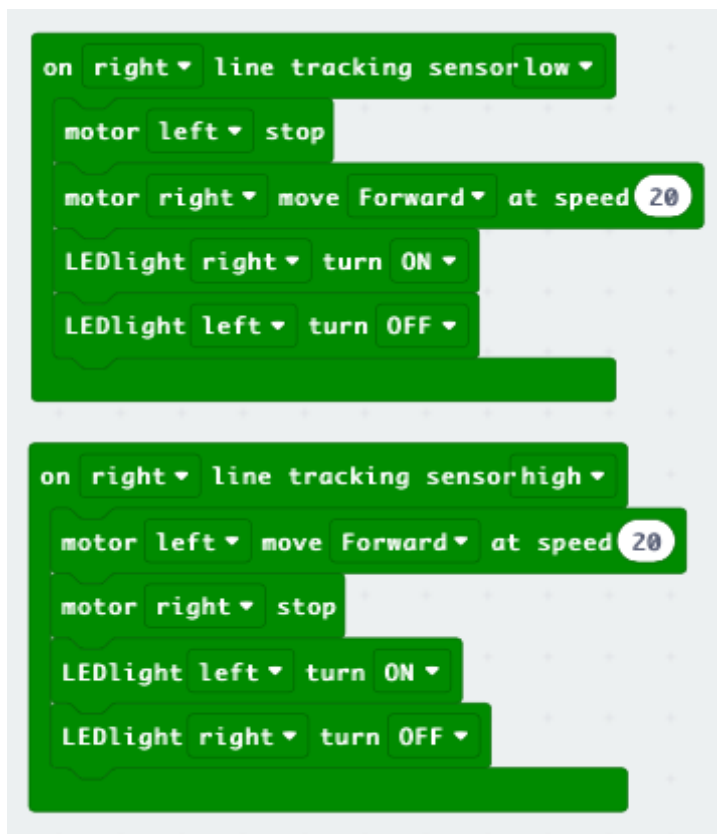

Watch it weave its way along the edge of the track

Try changing the speed. How fast can it go without coming off the track?

LED headlights

Use the LED headlights to show which way the robot is turning.

- 6) Add extra **LEDlight** instructions to your code, to turn the headlights on and off.

Save your work to a USB drive.
