QuizBot

Register/login at https://scratch.mit.edu

Make a talking scratch quiz.

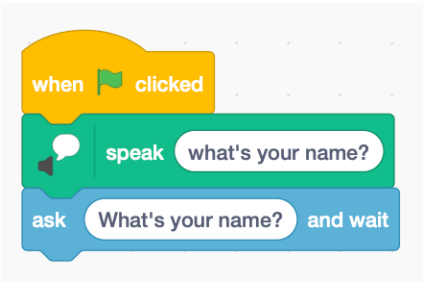

1) **Create** a New Project and give it a name

2) In **extensions**, add **Text to Speech** to make your project talk.

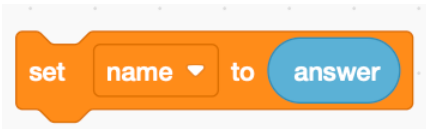

3) The QuizBot is polite and asks your name. Create a variable called **name** to store it.

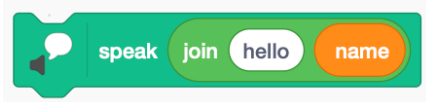

4) It **speaks** "*What's your name*?" To get input it will **ask and wait**. It must repeat the question so it appears on the screen as well as being read aloud.

5) Whatever you enter is in **answer** (in **sensing**). **Set name** to your **answer**.

6) Now **speak** "hello" and then your name. **Join** hello and your **name** together.

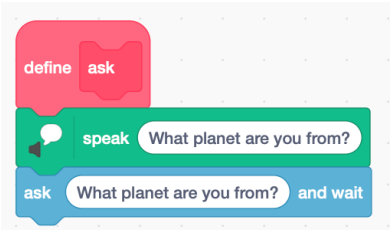

7) **Make a block** (in **My Blocks**) to ask a question. Call the new block **ask**. Add ask to the code above.

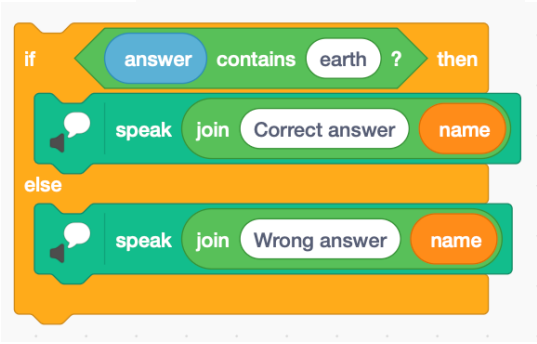

8) It should **speak** before **ask**ing a question.

This time, instead of saving the answer we must check if it's right or wrong.

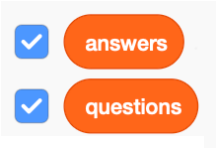

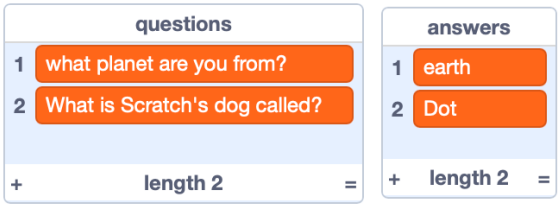

9) Add an **if … else** to check the answer. In the condition at the top see if the **answer contains** the correct answer. This works even if I said, "*I come from the planet Earth.*"

We want to ask more than one question. A good way to do this is to store your questions and answers in a List.

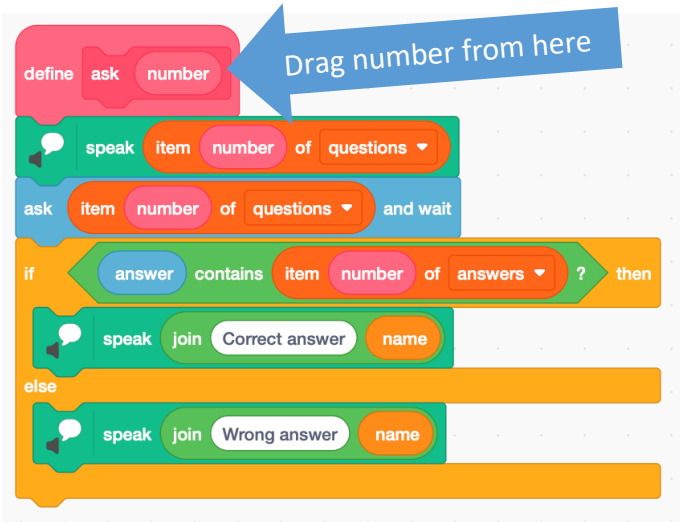

10) **Make a List** (in **Variables**) and call it **questions**. Make another List for the **answers**. Check the boxes next to them so you can see them.

11) Click **+** at the bottom of each list to add questions and answers.

12) Right click on your **ask** block to edit it. **Add an input** for the question **number**.

13) Edit your code to use the right **item number** of **questions** and **answers**.

14) Don't forget to ask all the questions in the main code.

Save** your code with a good name. **File > Save now
