Lego Robot Wars is a real thing.

<https://legorobotwars.weebly.com>

Adapt your Boost Kart to compete in Lego SumoBot.

The goal is to push each other off a table.

The last bot standing wins.

Add a weapon like a flipper to lift your opponent's wheels making them easier to push.

1. Attach a motor to the front of your SumoBot with the axle pointing sideways.
2. Plug it into Boost socket C (or D).
3. Design your Lego flipper and attach it to the motor axle.

Write code to control the flipper in Scratch.

The motor can be **rotated** through **1** whole turn, or half a turn $\frac{1}{2} = 0.5$, or a quarter of a turn $\frac{1}{4} = 0.25$

In **turn motor**, you can enter a **decimal** number like 0.25

or use a division operator like

How much of a turn do you need?

1. Add code (right) that flips it up and then back down again when you press the space bar. **Set motor speed** to **maximum** (100%) and **set motor direction** to **this way** or **that way**. **Rotate** motor C upwards then **reverse** it to turn it downwards.

Organise a knockout tournament where bots compete in pairs to decide the ultimate SumoBot.

Save your code with a good name. **File > Save now**
