Scores

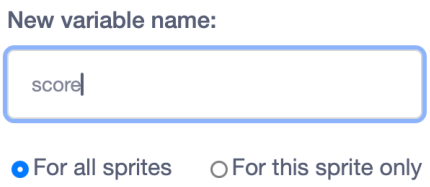

Register/login at https://scratch.mit.edu

Keep score in your games.

1) Use one of your existing Projects (e.g. QuizBot)

*Use a **variable** to keep score. Every sprite needs to be able to see the score so make sure that you make it **for all sprites**.*

2) Create a new variable, called **score**, to keep score. In **variables** click **Make a Variable**, input the name and select "*for all sprites*." Then click **OK**.

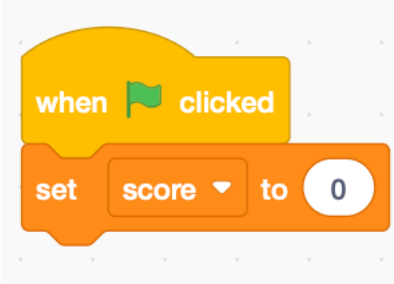

You want to see the score on the screen while you play the game.

3) In **Variables**, check the box next to **score**.

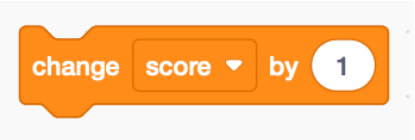

When a game starts you need to clear the score to zero.

4) Find a block that starts with the green flag and **insert** a block to **set score to** 0. Make sure the existing code is still attached.

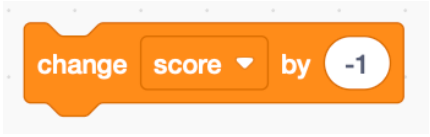

How do you gain points in the game? It could be getting a question right. How many points do you gain for each?

5) Find points in your game where you gain points (there could be more than one) and insert a block to **change the score**. Make sure the existing code is still attached.

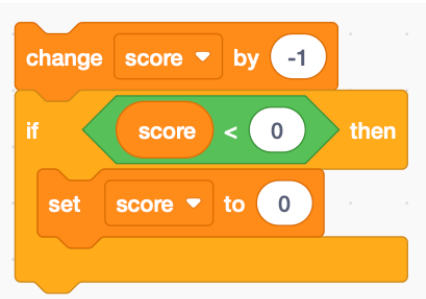

Can you lose points?

7) Find points in your game where you lose points and insert a block to **change the score** negatively.

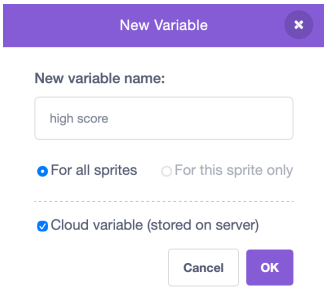

8) If you don't want to have *negative* scores then check the score right after you change it. If it goes negative (**score less than 0**) just **set** it to 0.

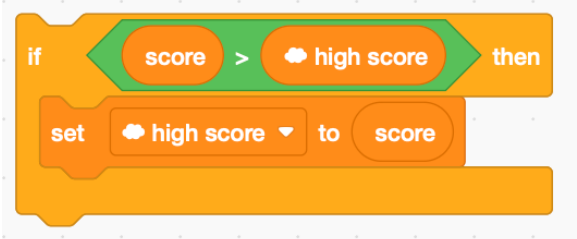

*If your Scratch account has been promoted to **Scratcher**, you can keep a high score that's saved between games.*

9) Check your profile page (by your name) and check your **profile**. Is there an invitation to become a **Scratcher**?

10) Create a new variable for the high score. If you can see **cloud variable**, tick the box.

11) At the end of the game check to see if you beat the high score.

***Save** your code with a good name.*
